

ENGINE PROTECTION PLATES DAKAR

249,00€

26851-001. Tripartite protection with replaceable individual elements. This allows an exchange of the individual parts, if necessary. Thanks to the tripartite construction, we were able to design a complex total protection.

Shock absorbing base plate: in contrast to the original engine protector, the protector Dakar is installed on a solid, consistent base plate. It is connected by strong rubber mounts, which can reversibly return to their original position after an impact. A tear out of the threaded holes in the motor housing can be prevented and the base holder can not bend (in contrast to the original, which is installed rigidly.) The facts: Front raised and three-dimensionally angled = snagging is impossible

Raised head pipe protection extended at the rear to protect the collector

no restriction of the ground clearance compared to the original

additional support frame for complete shock isolation between the protector and the motor housing.

4mm strong Aluminum

Slim design despite complete protection

Nearly indestructible thanks to the three-dimensional construction

No modification at the motorcycle necessary. Easy mounting.

All maintenance work possible without demounting

with inspection hole for oil change service

complete mounting kit Made in Germany
