Done with the hollow, ragged wheel hub. We provide the perfect finish for the hub design and its continuation in the light metal rims. We close the hub tunnel dynamically at both ends - at the hub itself and the final drive - so that a closed, perfectly harmonious unit arises.

Using an elaborate procedure we have worked a turbine profile into the covers, the dynamic appearance of which makes the hub itself and the swingarm into absolute eye-candy.

The covers are supplied in a refined yet very easy-to-fit unit that uses a clever expanding O-ring clamping method to mount it firmly in the hub tunnel. To ensure that no bolt heads spoil the appearance we also supply a special tool that hooks into the turbine holes, making it possible to fit the covers easily, securely and without any risk of damage.

The facts:

- Covers both ends of the hub tunnel with a turbine design.
- Improves appearance of hub.
- Same temperature conditions as original.
- Made of solid CNC turned/machined aluminium.
- Secure expanding O-ring clamping method
- Easy to fit, includes special fitting tool and two logos.
- Available in anodised titanium or anodised silver or black.
